

RUST-RAIDER™
PREPARES RUSTED METAL,
NEW METAL, ALUMINUM &
GALVANIZED METAL
FOR PAINTING

Rust Raider™ is a special blend of Phosphoric Acid, Sodium Bichromate and Surfactants formulated to react with iron oxide (rust) to chemically convert it to iron phosphate, forming a phosphate polymer corrosion resistant coating. It is also used to etch new ferrous metal surfaces, aluminum and galvanized steel prior to painting and is used as an adhesion promoter in adhesive bonding applications. Many leading paint manufacturers recommend using this type of product as a pretreatment coating to be used before priming and top coating.

Available Sizes

1840 - 32 fl oz. spray bottle
w/ spray applicator
6/case

1840NS - 32 fl oz. bottle
NO spray applicator
6/case

1841 - 1 US gallon bottle
NO spray applicator
4/case

1841-50 - 1 US gallon bottle

- Neutralizes Rust
- Converts Rust To A Phosphate Polymer Coating
- Etches Steel, Galvanized Steel & Aluminum
- Improves Adhesion Of Primers

- Stops Further Corrosion
- Professional Strength
- Extends Life Of Coatings
- Fast Acting
- Easy To Apply

NOTE: Removing and converting bleeding rust from painted surfaces can be accomplished, however, paint qualities vary greatly and dulling and/or peeling may occur. Always test RUST-RAIDER on a small area first. International Epoxies & Sealers assumes no liability for damages to finished surfaces.

1840 RUST RAIDER Test Plates

Treated with
1840 Rust Raider ↘

↙ Untreated

Neutralizes rust
and prevents
further corrosion!

Converts the rust
to a phosphate
polymer coating
and is now ready
to be painted!
